

Adv Data Wrangling P2 Mindmap #4

* Sequence of characters
put together, usually
words used for categorical
variables *

Strings

Key Functions
for strings are
useful for manipulating
data

You can extract
data from
strings.

- separate string into rows
- separate string into column
- Diagnosing widely
known

str_detect()
returns a logical
vector that is
true if pattern matches
an element

str_count()
uses logic in
str_detect to tell
you how many of
something is in
each string

Value Replacement
str_replace()
str_replace_all().
w/ 'all' replaces all
matches and str_replace
replaces the first match.

Commands
str_flatten()
str_c()
str_glue()
separate_wider_delim()
str_length()
str_sub()
